<b>Product</b>	Imoticon ID700

<b>Title</b>	Implementing a bi-polar speed using a single potentiometer
--------------	--

<b>Summary</b>	This document gives information on how to set up the ID700 for a bi-polar speed reference (-50Hz to +50Hz) using a 0 to 10V supply and a speed potentiometer without having to use a reverse switch.
----------------	--

**NOTE:** Please read this document in conjunction with the Imoticon ID700 Easy Start Guide and Imoticon ID700 Advanced User Manual.

**Terminal connections**

### Parameter set up (from factory default settings)

P00.04 = 1 : Control mode – terminal mode

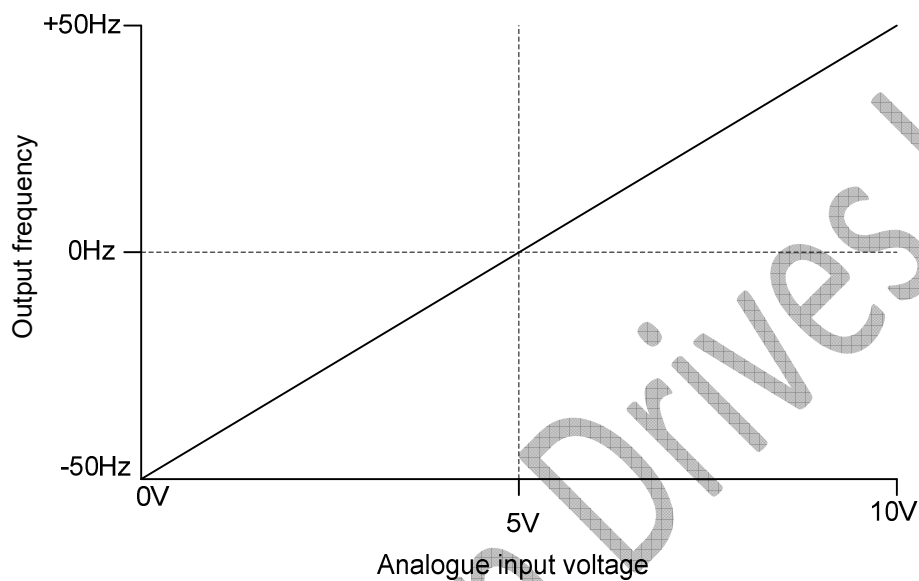

P00.05 = 3 : Reference select – analogue input 1 (AI1)

P00.23 = 1 : Extended group access

P08.04 = -50.0 : Analogue input offset

P08.05 = 2.000 : analogue input scaling

### Analogue input vs output frequency characteristic

It can be seen from the above characteristic, when the potentiometer wiper is at 0V, the output frequency is -50Hz. At 5V the output frequency is 0Hz and at 10V, the output frequency is 50Hz.
